TREDENCE AI GRADS · PROJECT EVALUATION

Solution Core85

Milestone 1 · Healthcare Liver Disease
Submission:
Submission-Milestone1/M1_Healthcare_Solution_Core85.ipynb
Evaluated: 06 Nov 2026

91 / 100
Distinction · 91%

Criterion-wise marks

Data Understanding & Quality Checks — 18 / 20

Strong data understanding and quality checks are demonstrated, including target verification and join validation. Slightly more explicit discussion of identifier columns and their exclusion at this stage would improve clarity.

Exploratory Data Analysis (EDA) — 18 / 20

Good use of visualizations to explore target balance and clinical feature distributions. Could be improved by including summary statistics or stratified plots by target class to deepen insight.

Data Cleaning & Feature Engineering — 17 / 20

Appropriate missing value handling and leakage prevention are evident. However, no explicit outlier detection or justification is provided, and no additional feature engineering is performed, which limits marks here.

Linear Model Building — 20 / 20

The baseline model is well constructed with proper stratification, preprocessing, and reproducibility. Use of class weighting is appropriate for imbalance.

Evaluation & Findings — 18 / 20

Comprehensive evaluation metrics are reported and discussed with responsible limitations. Could improve by deeper analysis of false negatives or error types.

Strengths

• Thorough data loading, target verification, and join validation with clear evidence of data quality checks.
• Appropriate and clear exploratory data analysis with relevant visualizations.
• Well-constructed logistic regression baseline with stratified splitting and balanced class weighting.
• Comprehensive evaluation metrics reported with responsible interpretation and limitations discussed.
• Explicit exclusion of identifiers to prevent leakage.

To improve next time

• Include explicit outlier detection and handling with justification.
• Perform and document feature engineering beyond encoding, such as interaction terms or derived features.
• Add summary statistics and stratified EDA plots to deepen understanding of feature-target relationships.
• Provide more detailed analysis of false negatives and error patterns.
• Clarify handling or exclusion of identifiers earlier in the data understanding section.

Overall feedback

The submission demonstrates a strong understanding of the data and problem, with careful data quality checks, appropriate exploratory analysis, and a well-constructed logistic regression baseline model. Evaluation metrics are comprehensive and responsibly interpreted with clear educational disclaimers. To reach full marks, the submission should include explicit outlier handling, more advanced feature engineering, and deeper analysis of errors and feature-target relationships. Overall, this is a solid Milestone 1 submission aligned well with the rubric and problem statement.

AI-generated evaluation against the milestone rubric. Subject to trainer review. Each submission is evaluated once; this score is recorded.
