TREDENCE AI GRADS · PROJECT EVALUATION

Participant_02

Milestone 3 · Healthcare Liver Disease
Submission:
Submission-Milestone3/Participant_M3_02_healthcare_strong.ipynb
Evaluated: 27 Oct 2026

70 / 100
Merit · 70%

Criterion-wise marks

Neural Network Design & Implementation — 20 / 25

The neural network architecture is appropriate and training settings are documented. However, more detailed documentation on activation functions, optimizer, or architecture rationale would improve clarity.

Data Preparation & Training — 18 / 20

Data preparation is leakage-aware and uses appropriate encoding and scaling. Early stopping is applied. However, no explicit mention of validation set or cross-validation for hyperparameter tuning is present.

Model Evaluation & Overfitting Analysis — 12 / 20

Metrics on held-out data are provided, but the submission lacks detailed overfitting assessment such as training vs validation curves or error analysis.

ML vs DL Comparison — 15 / 15

A clear and fair comparison between ML and DL models is presented with relevant metrics on the same test data.

NLP Implementation & Findings — 5 / 20

Initial data loading and inspection is shown, but the defined NLP task is not completed or evidenced beyond data loading.

Strengths

• Well-structured neural network with documented architecture and training settings.
• Leakage-aware data preprocessing with appropriate encoding and scaling.
• Use of stratified train-test split and early stopping to improve model robustness.
• Direct comparison of neural network and Random Forest on the same test set with multiple metrics.

To improve next time

• Provide more detailed neural network architecture documentation (activation functions, optimizer).
• Include validation set or cross-validation for hyperparameter tuning and more robust training.
• Present training vs validation metrics or learning curves to assess overfitting explicitly.
• Complete the NLP task with actual processing, analysis, or summarization of the healthcare education text.

Overall feedback

The submission demonstrates a solid neural network implementation and a fair comparison with a Random Forest baseline using appropriate preprocessing and evaluation metrics. However, it lacks detailed overfitting analysis and does not complete the NLP task beyond initial data loading. Enhancing documentation and completing the NLP component would strengthen the milestone deliverables.
